AGRADEZCO A PLAN LERMA, ASISTENCIA TECNICA,
LAS FACILIDADES QUE ME BRINDARON PARA LA -
REALIZACION DEL PRESENTE TRABAJO.

DEDICO LA PRESENTE TESIS CON TODO CARIÑO, A TI TIA JOSEFINA POR TU AYUDA, AFECTO Y CARIÑO QUE ME HAS BRINDADO DESDE LA AUSENCIA DE MI MADRE. Y A TI PAPA POR TUS CONSEJOS DE HONRADEZ Y TRA BAJO.

TAMBIEN CON AFECTO A MIS FAMILIARES,

SOBRETODO A TI TIA LUPE.

A MIS MAESTROS QUE TRATARON DE TRANSMITIRME SUS CONOCIMIENTOS. EN ESPECIAL AL DOCTOR -- GILBERTO GOMEZ PRIEGO POR SU DIRECCION EN EL PRESENTE TRABAJO, SU AMISTAD Y AYUDA INMERECIDA QUE ME HA DISPENSADO.

A MIS COMPAÑEROS Y AMIGOS

I N T R O D U C C I O N

El estado de Jalisco con una superficie total de -- 81 058 Kms.^{2}, posee magníficos terrenos aptos para la agricultura y extensas zonas propicias para el desarrollo de la ganadería, especialmente en sus ramas Bovina, Porcina y Avícola.

Desde 1930, Jalisco ocupa el primer lugar en el - - País en cuanto población porcina, con el 12.7% de la población total. Su desarrollo acusa un incremento de un 10.7% anual,de 1958 a 1963, situándose en el primer lugar entre los Estados-productores. Con relación a la clase animal, a pesar de que - en la generalidad de los casos puede considerarse buena,falta aún mucho por mejorarla.

Tomando en cuenta todo esto, Plan Lerma, Asistencia Técnica, determinó iniciar un programa de producción de pié - de cría porcino de registro, mediante la obtención de animales seleccionados que han de mejorar la calidad génetica de - la especie en la República Mexicana.

Para lograr este propósito, se partió de la adquisición de cerdos registrados, de las razas Duroc, Hampshire y - Yorkshire, cuidadosamente seleccionados, tanto en sus características fenotípicas, como en su árbol genealógico. Para realizar el programa, se preparó de tal manera, que fuera posible proporcionar a los porcicultores sementales y hembras de-cada una de estas razas, para que a su vez ellos pudieran obtener animales de reposición sin tener que depender permanentemente de la adquisición de ellos de los Estados Unidos de - Norteamérica.

En la actualidad, la porcicultura del País se encuentra mal desarrollada debido a la falta de recursos técnicos y económicos; teniéndose que en la mayoría de los casos - se trabaja en forma tradicional, con animales de baja calidad

génetica, cuyos rendimientos son mínimos. Se emplea en su alimentación raciones mal balanceadas que elevan el costo de producción, existe una elevada mortalidad además de una baja conversión alimenticia, debido sobre todo a las prácticas inadecuadas de manejo.

Por tal motivo, este trabajo tiene por objeto dar a conocer al porcicultor las ventajas que se obtienen al conocer la consanguinidad de su población porcina, el porqué de la consanguinidad de los cerdos de registro y los problemas que se puedan presentar cuando no se conoce el coeficiente en este aspecto en una población animal.

I.- MATERIAL Y METODOS

Este trabajo P.L.A.T. lo realizó en las instalaciones que tiene en el Centro de Fomento Ganadero "Los Belenes" - propiedad de la Secretaría de Agricultura y Ganadería, utilizando 239 hembras y 20 machos, de los cuales 160 hembras y 13 machos son de la raza Duroc; 60 hembras y 6 machos de la raza-Hampshire y 19 hembras y un macho de la raza Yorkshire.

Con excepción del pie de cría Yorkshire, en que sólo existen una línea formada por un macho y 19 hembras, el resto-de las líneas de las razas Duroc y Hampshire están compuestas-por un macho y 10 hembras.

Cada una de las líneas que integran el Programa ha sido formada tomando en cuenta tanto el aspecto genotípico,contenido en el árbol genealógico, como en el aspecto fenotípico.

En la primera fase del programa se formaron 13 líneas: 8 líneas Duroc, 4 líneas Hampshire y una Yorkshire. Posteriormente fueron formadas 10 líneas más, siendo 8 líneas Duroc y 2 Hampshire.

Las líneas formadas son las siguientes:

DUROC: Colima,Guanajuato,Jalisco,Michoacán,Nayarit, San Luis,Sinaloa,Sonora,Durango, León, Morelia,Guadalajara,Puebla,Toluca,-Veracruz y la Piedad.

HAMPSHIRE: México,Querétaro,Aguascalientes,Zacatecas Zapopan y Tepatitlán.

YORKSHIRE: Guerrero

Para el cruzamiento de cada una de las líneas se usó una clave para su identificación, siendo ésta como sigue: Cada clave está compuesta por cifras, separadas éstas por guiones y por letras. Las cifras iniciales indican el número del macho y el de la hembra.

Para las cifras del 11 al 999, el primer número co - rresponde al macho en tanto el segundo como el tercero corresponde a hembras. Ejemplo: 11 (macho 1, hembra 1); 232 (macho- 2, hembra 32). Las cifras mayores de 1000 que se encuentren antes de la letra están separadas por un guión, siendo los números de la izquierda correspondientes al macho y los de la derecha a la hembra, Ejemplo: 2-135 (macho 2, hembra 135). La letra representa la inicial del nombre de la línea.Ejemplo: J,línea Jalisco. La cifra colocada a la derecha de la letra que -- identifica a la línea, corresponde a: los dos primeros números del año y el tercero al número de cruzamiento en este año. Ejemplo; 671 (año 67, cruza 1); 682 (año 68, cruza 2).

Para cada una de las cruzas programas se ha obtenido el coeficiente de consnguinidad, utilizando la información del árbol genealógico de los ancestros de dos generaciones (o sea hasta abuelos). Este coeficiente ha sido obtenido mediante el empleo de la fórmula:

$$Fx = \left[\sum (1/2)^{n+n'+1} Fa \right] \qquad Fx \quad \frac{1}{2} \quad Fa$$

Fx = Coeficiente de consanguinidad

N = Número de generaciones entre el padre y el ancestro - común.

n = Número de generaciones entre la madre y el ancestro - común.

Fa = Coeficiente de consanguinidad del ancestro común.

Conocidas las ventajas de la consanguinidad, se han- hecho cruzamientos consanguíneos y no consanguíneos. Esto re - presenta una ventaja para el porcicultor que adquiera su pie - de cría, ya que podrá conocer el coeficiente de consanguinidad del animal que compre, sin riesgos de los defectos indeseables.

Por otro lado, los animales consanguíneos llenando - los requisitos mínimos de selección previamente establecidos,-

Podrán ser utilizados por el porcicultor para llevar a cabo - una engorda más exitosa.

A continuación se presentan los cuadros que se señalan los porcentajes de consanguinidad de cada una de las cruzas programadas.

Para cada una de las cruzas establecidas en el programa, se ha obtenido el grado de "compatibilidad" del producto de dicha raza, con el producto de todas y cada una de las otras cruzas dentro de la misma raza. Este grado de compatibilidad equivale al coeficiente relación existente entre los machos y hembras de una cruza, con los machos y hembras de otra cruza.

El coeficiente de relación es análogo al doble del coeficiente que tiene el producto de la cruza, en la cual existe un porcentaje de relación.

Esto permitirá al porcicultor que desea adquirir machos y hembras, conocer de una manera cuantitativa si al efectuar una cruza, el producto de la misma será consanguíneo o no.

El coeficiente de relación con ancestros conocidos por dos generaciones, ha sido obtenido mediante la aplicación de la siguiente fórmula:

$$Fxy = \left[\frac{(1/2)^{n+n'} \quad (1 + Fa)}{\sqrt{(1 + Fa)} \quad \sqrt{(1 + Fy)}} \right]$$

Fxy = Coeficiente de relación

n = Número de generaciones entre el individuo X y el ancestro común.

n = Número de generaciones entre el individuo Y y el ancestro común.

Fa = Coeficiente de consanguinidad del ancestro común.

Fx = Coeficiente de consanguinidad del individuo X.

Fy = Coeficiente de consanguinidad del individuo Y.

Al adquirir el porcicultor un lote de hembras y un macho o varios, para cruzarlos, es informado del coeficiente de relación o grado de compatibilidad que existe entre ellos.

Si el coeficiente es de 0, significa que al efectuar la cruza el producto resultante no es consanguíneo. Si el coeficiente tiene un valor, por ejemplo: de 0.1250 significa que los animales que se obtengan de esa cruza, tendrán un coeficiente de consanguinidad equivalente a la mitad, o sea, de 0.0625.

El porcicultor puede normar su criterio respecto a si desea o no utilizar animales relacionados entre sí, y utilizar la consanguinidad en sus diversos grados, en sus programas de cruzamiento.

A continuación se presentan los cuadros de compatibilidades de los cruzamientos en cada una de las líneas y cruzas que forman el programa.

D I S C U S I O N

En la formación y perfeccionamiento de todas las razas ganaderas, la consanguinidad ha sido utilizada en mayor o menor grado, para fijar o uniformar las características de la raza en cuestión.

Un criador debe calcular el coeficiente de consanguinidad con objeto de saber con qué ritmo se va a establecer la homocigosis. Por otra parte, para fines de selección, se necesita saber el grado de consanguinidad de cada animal, con objeto de poder conservar los mejores animales dentro de cada nivel de consangunidad, pues en otra forma, podrá tender a conservar los animales menos depurados a expensas de los que han progresado más.

Al controlar las parejas de animales dentro de un hato o grupo, y al seleccionar los rasgos deseables, el criador tiene a su disposición un método apropiado para dirigir la evolución del grupo. Puede restringir las parejas a un pequeño círculo de animales a través de la consanguinidad y de este modo la introducción del germo plasma de extraños. Este proceso tiende a disminuír la variación dentro del grupo y a estabilizar el tipo, De este modo se obtienen ejemplares regristrados. Al limitar las cruzas al azar y con ello una desviación genética, también puede lograrse dirigir la evolución hacia la meta perseguida por el criador.

Es común observar en muchos casos, cómo la consanguinidad intensa se ha reflejado infortunadamente, siendo manifiestas diversas características, debida que genes recesivos se han concentrado en los descendientes de algunos encestros comunes. Ha ocurrido con frecuencia, que las expresiones de los rasgos indeseables aumentan en algunos criaderos de reses a medida que se ha intensificado la relación consanguínea y la

la selección del tipo.

Generalmente, la consanguinidad en organismos capaces de efectuar intercruzamientos, tiende a estabilizar el tipo y a debilitar a los individuos. La explicación para esta debilidad se funda en la acumulación de genes recesivos perniciosos en condición homocigótica. Al seguir efectuando los cruzamientos entre parejas al azar, por lo común quedan rasgos recesivos heterocigóticos que casi nunca vienen juntos para hacerposible la expresión de que los genes recesivos tiendan a manifestarse porque algunos genes en los individuos apareados, relacionados entre sí, habrán provenido de ancestros comunes. Tales genes que se manifiestan por sí mismos en las poblaciones naturales, están sujetos a la selección natural. Los individuos deficientes o defectuosos son erradicados. La raza puede mejorarse por la expresión y la eliminación de los genes recesivos. En un medio ambiente variable, las mutaciones que inicialmente eran perniciosas, pueden volverse ventajosas y contribuír a la adaptación y evolución de la especie.

Las combinaciones que involucren tales mutaciones también pueden alterar su significancia de adaptación.

Las poblaciones de los organismos que se aparean por medio de cruzamientos y que están sujetas a las relaciones por consanguinidad, en un ambiente más o menos constante, tienden a retener algunos conductores de genes recesivos. La ocasión de eliminar completamente los genes recesivos indeseables en tal población, es remota, aún en el caso de que la consanguinidad sea muy estrecha y persistente por un largo período. En contraste con el cruzamiento entre individuos consanguíneos entre individuos consanguíneos, la multiplicación entre no consanguíneos disminuye la consistencia del tipo, pero aumenta al menos temporalmente, el vigor de los individuos.

Este tipo de parejas tiende a conservar los pares de

genes heterocigóticos y de este modo protege a los recesivos de las fuerzas de la selección natural. La multiplicación entre los no consanguíneos es importante, porque provee heterocigocidad y mayor variación para que trabaje la selección natural.

Si toda evidencia indica que la consanguinidad lleva resultados problemáticos, en que las probabilidades son -- más bien de pérdida que de ganancia.¿ Porque no abandonar este sistema del todo?. La contestación a esta pregunta radica en varios hechos importantes.

En primer término, todo buen criador tiene la ambición de lograr resultados menos inseguros en sus operaciones de cría. La consanguinidad que acarrea automáticamente un aumento de homocigosis, vuelve a una población genética más uniforme y por lo tanto, más semejantes las crías a sus progenitores. En la formación de las razas en que se desea un grado de fijación de ciertos caracteres, la consanguinidad en manos de criadores hábiles ha dado este resultado.

Por otra parte, la consangunidad puede acarrear un beneficio de purificación, pues descubre defectos recesivos en una población. En esta forma se pueden erradicar por completo ciertos genes indeseables (principalmente los letales), que en una población no consanguínea se seguiría perpetuando. Experimentos de consanguinidad con ganado, han descubierto recesivos que producen defectos de la piel, huesos, nervios y esterilidad. Es evidente que una población que se deshace de estos defectos antes de multiplicarse y expandirse, es una población con ventajas económicas.

Algunas de las ambiciones teóricas y prácticas de propagandistas entusiastas de la consanguinidad, no han sido justificadas. En un tiempo se llegó a creer que mediante consanguinidad sería posible obtener super-razas con todos los caracteres más productivos en forma homocigósica y por lo tanto, sin nuevas variaciones.

También esta teoría ignoraba que un cierto grado de genes en - estado heterocigótico, son benéficos a la sobrevivencia de la- población. Por lo tanto, la promesa de purificación de razas - consanguíneas invariables para la alta productividad parece -- ser de imposible obtención, es sin embargo, a través del cruza miento entre grupos hemogeneos (consanguíneos), que se puede- planear la obtención de un grado de heterocigosis útil a la ex plotación comercial.

C O N C L U S I O N E S

Para elevar la productividad porcina en el País, se-requiere básicamente contra con:

1).- Una calidad uniforme en lo referente a pureza de raza. Salvo un pequeño porcentaje de porcicultores que por iniciativa propia y orientados técnicamente tiene criaderos-de cerdos de raza pura, la mayoría no atienden las más -- elementales leyes de la herencia, ya que aparean animales sin cuidar de la consangunidad ni raza entre macho y hembra.

2).- Debe procederse a efectuar explotaciones racionales en -- las que se conozca el árbol genealógico de los cerdos nacidos en ellas, para así conocer sus características hereditarias. Además se requieren datos precisos sobre la calidad de sus progenitores y con ello saber como utilizarlos como elementos de pié de cría para mejorar la calidad de las piaras.

3).- Conocido el árbol genealógico de los cerdos nacidos en el País, se estará en posibilidad de realizar un programa de cerdos híbridos, sin tener que depender de la compra de - pié de cría en el extranjero. Se desarrollaría una fami - lia de cerdos dentro de una misma raza adaptada a las características del País, evitando con ello las bajas que - causa la adaptación al medio, a la vez de elevar la calidad de las piaras de los pequeños porcicultores, para los que resultaría costoso importar sementales o hembras del-extranjero.

4).- Considerando las posibilidades económicas de la mayoría - de los ganaderos el programa del pié de cría nacional con una genealogía conocida, sería pequeña, pudiendo para el-

efecto, formarse líneas genealógicas de una raza determina da, que apareándole con animales importados del extranjero superarían la calidad de las piaras.

5).- Para controlar la pureza de las razas, la calidad de los - cerdos y la garantía del comprador, las actividades de la- Asociación Nacional de Registro de Ganado Porcino, serán - definitivas.
